SUMMARY

Cybersecurity undergraduate with hands-on experience in SIEM (Wazuh), SOC operations, and threat detection workflows. Skilled in log analysis, alert triage, and identifying security anomalies to support incident response. Currently building backend systems for a pentest attack-chain discovery platform, combining security operations with engineering. Strong interest in detection engineering and AI-driven SOC platforms.

EXPERIENCE

CyART Tech | SOC Intern & Backend Security Developer *Jan 2026 – Present*

- Monitor and analyze security alerts in a SOC environment to identify threats and anomalies
- Perform log analysis and alert triage to support incident detection and response workflows
- Develop backend architecture for a pentest attack-chain discovery platform
- Design database schemas for vulnerability and attack path correlation
- Build REST APIs to ingest and process security findings across systems
- Create data pipelines to map relationships between vulnerabilities and potential attack chains
- Collaborate on integrating security tools and improving detection visibility

iTechFixr | Cybersecurity Intern *Jun 2025 – Aug 2025*

- Monitored SIEM dashboards and investigated security events
- Analyzed security logs to detect anomalies such as failed logins and suspicious activity
- Worked with Active Directory (user management, GPOs)
- Supported SOC-style incident monitoring and alert triage workflows

DCDIUM Technologies | Cybersecurity Intern *Jun 2024 – Aug 2024*

- Installed and configured Wazuh SIEM on Ubuntu for centralized monitoring
- Analyzed logs to identify vulnerabilities and abnormal system behavior
- Gained exposure to enterprise security monitoring lifecycle

CyberVidhyapeeth Foundation | Cybersecurity Intern *Jun 2023 – Aug 2023*

- Applied OSINT techniques for intelligence gathering and analysis
- Conducted digital footprint analysis for cybersecurity investigations
- Built foundational knowledge in Rust for security applications

PROJECTS

SIEM Application – Wazuh Implementation

- Deployed and configured Wazuh SIEM for log monitoring and intrusion detection
- Built dashboards for real-time security event visualization

- Simulated SOC workflows for alert analysis and response

AI-Based Driver Assistance System

- Lane Detection: Developed a real-time lane tracking algorithm using Python and OpenCV. Implemented Canny Edge Detection and Hough Transform techniques to identify road boundaries under varying lighting conditions.
- Pedestrian Detection: Engineered an object detection system using machine learning classifiers (Haar Cascades) to identify pedestrians in video feeds, optimizing for low-latency response.
- Drowsiness Detection System: Developed a safety system to monitor driver fatigue via real time eye-tracking. Implemented facial landmark detection algorithms to trigger audio alerts when signs of sleepiness are detected.

OSINT & Digital Footprinting

- Used OSINT tools to gather and correlate publicly available data
- Applied analysis techniques for cybersecurity investigations

SKILLS

Cybersecurity:
SIEM (Wazuh), Threat Detection, Log Analysis, SOC Operations, Active Directory, OSINT, Network Security

Backend & Systems:
API Development, Database Design, Security Data Processing

Programming:
Python (OpenCV, NumPy, Pandas), Java, JavaScript, PHP

Tools & Platforms:
Wireshark, Git, Linux (Kali, Ubuntu), Windows
